

1 Q. Please provide Hydro's fuel unit conversion documentation utilized to convert the prices of
2 the various fuels used by Hydro's thermal and gas turbine assets into equivalent prices for
3 energy production (e.g., \$/MWh).

4

5

6 A. PUB-NLH-045, Attachment 1 provides an Excel fuel conversion document used to convert
7 Newfoundland and Labrador Hydro's forecast fuel prices for its various fuel types into input
8 parameters that can be used in PLEXOS. The process begins with the fuel series forecast in
9 CDN\$ per litre provided in the Corporate Assumptions developed by Nalcor's Investment
10 Evaluation group. The price per litre is then converted to a price per gigajoule, using the
11 formulas as provided in Attachment 1.

12

13 PLEXOS uses the forecast price per gigajoule and the unit's heat rate to determine which
14 resources are required to meet customer requirements, in economic dispatch order. For
15 completeness, the heat rates of Newfoundland and Labrador Hydro's units are also
16 provided in PUB-NLH-045, Attachment 1. The combination of the heat rate and fuel series
17 forecast are all used by PLEXOS to determine the equivalent price for energy production
18 (\$/MWh).

¹. Post 2023 extended from existing corporate assumptions for Stephenville and Happy-Valley based on Holyrood and Hardwoods fuel series. Published Corporate Assumptions cover period to 2023 for Stephenville and Happy Valley.

². Barrel ("bbl").

³. Gigajoule ("GJ").

⁴. One million British Thermal Units ("MMBtu").
